on Sale EVERY DAY UNTIL SOLD

Alister & Beatie

GREENVILLE, S. C.

Mitchell

NOW-A-DAYS the farmer wants the best in everything he buys. "The Farmer's Trade" doesn't require anything different from the city trade you wear just as good clothes, and drive just as good an automobile as the man on the city boulevard.

The MITCHELL Car is the farmer's car just because it's any man's car who wants a good one. It is built TO STAND "THE ROAD"—any road to go where you're going, and keep on going as long as you want it to.

The MITCHELL Automobile is made by the same people who have made the Mitchell farm wagon for 77 years; made in the same thorough way to last and give service. The New Six Cylinder 48-Horse Power is a great city or country car.

- Four Cylinder, Five Passenger, 30 H. P. Mitchell \$1,350.00
 - Four Cylinder, Four Passenger, 30 H. P. Mitchell \$1,150.00
 - Four Cylinder, Two Passenger, 30 H. P. Mitchell \$1,000.00
- They are all Mitchells and they are all good. All fully equipped.
- See us for demonstration
- Yours truly,

THE SENTINEL

Analysis of Our Goods This Year

We want to show you how our goods analyze this year:

Our 16 per cent Acid analyzes	17.41
Our 10-4 analyzes	1039.425
Our 8-3-3 analyzes	8.91-3.11-3.28
Our 9-5-2 analyzes	9.52-4.24-3.78
Our 10-3-3 analyzes	10.68-3.40-3.78
Our 10-4-4 analyzes	10.75-4.34-4.44

We haven't an analysis of our 8-4-4 at hand but anyone who has ever seen the crops made where our 8-4-4 is used would not stop to ask about an analysis. The crops speak for themselves. It refreshes a man's soil and the earth yields up her increase.

Buying 8-4-4 is like buying an Ames shovel, or a Disston saw, or a Rodgers knife, or a Remington type-writer, or dealing with the Farmers and Merchants Bank at Anderson—you don't make any mistake. You run no risk and take no chances because you are getting the very best in the respective lines.

The analysis of fertilizer does not mean anything until you know the source of ammonia in the fertilizer. The difference in the phosphoric acid and in the potash of the different manufacturers of fertilizer does not cut much figure, because it is all practically the same. One is about as good as another.

The difference in fertilizer depends upon the ammonia used. We use a little of nitrate of soda to make the crop start off nicely, and then we use blood, tankage, fish, cotton seed meal and sulphate of ammonia. This makes the best goods put in sacks and it makes a goods that will analyze well.

A manufacturer can get ammonia from hoof meal, horn meal, and leather meal, and make a fertilizer that will analyze higher than ours, and can make so that it will sell for \$3 a ton less than we can sell ours and make more profit per ton than we make on ours. This may account for some of the low prices you hear of. But the goods won't make the crops that our goods will make, for the reason that hoof meal and horn meal and leather meal are available as plant food. They are not available as plant food. They are not available as plant food. They are not available for the simple reason that they are not soluble in water. Hoof meal, and horn meal and leather meal are hoofs and horns and leather ground finely, just as corn meal is corn ground finely. You can take hoof meal and horn meal and leather meal and put it in water and let it stay for a year and go back to it and the hoof meal and horn meal and leather meal are not dissolved. They can't possibly become plant food until they do dissolve.

Now sown and cotton are planted and get their growth and maturity within seven months. If hoof meal and horn meal and leather meal can't be dissolved in water in a year, they can't become plant food in seven months.

Now frankly, we don't suppose any fertilizer manufacturer gets his ammonia solely from hoof meal and horn meal and leather meal. We don't doubt that those who use it mix it with tankage; for very few manufacturers use blood and fish. They mix it with tankage for cotton seed meal, but the ammonia in their fertilizer is unavailable just to the extent that they use the hoof meal, horn meal and leather meal.

When you remember that only about 1-30th of an ounce of ammonia gets to each plant, you can see that it will be necessary for all of this 1-30th of an ounce to be available. You can make but one crop year and as cotton in this country is the money crop, it would seem to be desirable to get the best fertilizer for it.

We don't use hoof meal or horn meal or leather meal in our factory. We don't suppose that any manufacturer in creation would admit the use of it if he did use it, but you are at liberty, and anyone else is at liberty to visit our factory at such times as he wishes, with or without notice to us of your coming, stay as long as you please, go through the buildings, take samples of any and everything you see and have it analyzed for your own satisfaction. You may have an analysis made on suspicion at any time or anywhere you wish. We run an open shop all the year 'round.

The law requires the fertilizer manufacturers to put the source of ammoniate used in his fertilizer on a tag to be attached to each sack. The tags on our fertilizers show that we get the ammonia from blood, tankage, cotton seed meal, sulphate of ammonia, and fish. The tags on most other fertilizers give the source of ammonia as "organic" and "mineral." Mineral sources are sulphate of ammonia and nitrate of soda. Organic may mean anything, you can't tell what it means from the tag. When you buy fertilizer with a tag on it you are buying a pig in a poke. This may also account for some low prices you hear of. When a man has a thing to sell he usually gives the best description of it that it will stand.

Some people every year mix their fertilizer. They buy acid, cotton seed meal, kainit and muriate and mix their own goods. Their only source of ammonia in this goods is cotton seed meal, which is very good while it lasts. It gives out about the time the cotton begins to fruit and that cause it to shed.

New, if blood, tankage, sulphate of ammonia, and fish are worth anything in fertilizer, our goods must be better than your home mixes goods, where you use none of these ammoniates.

By using cotton seed meal only as an ammoniate, you may make a 8-3-3 for \$2 a ton less than we ask for it.

That \$2 a ton represents a difference of from 40 to sixty cents an acre on your fertilizer bill. We don't think there is any doubt that 8-3-3 ammoniated as we ammoniate it will make 100 pounds of lint cotton to the acre more than a home mixed fertilizer with cotton seed meal as the only source of ammonia. This 100 pounds of lint cotton is now worth about \$10.50. We don't know what it will be worth next fall—off hand we should say \$8 to \$12. It doesn't seem likely that cotton will bring over 12c next fall, and we sincerely hope it won't bring less than 8c.

Where farmers have been using the best fertilizers and using it freely wish to suggest to them the propriety of using an inferior goods, and using it less freely, as if they do their lands will become run down.

Most farming lands in this section are in a good state of cultivation. It will be cheaper to keep them that way than to let the land run down and then bring it up. If you have a fat horse it will take less corn to keep him fat than it will to let him get poor and then fatten him up again.

It is the same way in fertilizing your land, and besides you will lose the extra crop that you failed to make while your land is run down. Our 10-4 and 10-6 are good fertilizers to use where your lands are flat or where cotton grows very rank and some of the bolls fail to open. This extra percentage of phosphoric acid in the 10-4 and 10-6 will give the cotton boll an early maturity. And when a cotton boll is grown it opens, just as when a water-melon will ripen when it is grown and it won't ripen until it gets its growth.

We want to urge you to use on your ordinary lands our 8-3-4, 9-3-3, 8-4-4, 10-4-4 and 10-3-3. You will get more ammonia and less filler and you will get more fish in these fertilizers than in any others. We can make any analysis you want. Making fertilizer is like making clothes. You can take a bolt of cloth to a tailor and from that bolt he can make a suit of clothes to fit a 10 year old boy, and by using more cloth he can make a suit of clothes to fit a man weighing 250 pounds.

And now a last word to the home mixers. If you use the same ammoniates we use your goods will cost you more than we ask you for ours, and your goods won't be as well made as ours because you are not equipped for it. If you don't use the ammoniates we use your goods will not be as good as ours, nor as well manipulated.

If you give two cooks the same material for making bread one will make better bread than the other. The more experienced cook will make the bread. And the fertilizer man who gives his time and thought to it and has the equipment, is bound to mix it better than the man who only mixes a few days in the spring of the year without the equipment.
